Our Team

Process Protection Inc. ensures a balanced approach to our consulting services with highly technical expertise and commensurate business acumen. To achieve this our team is comprised of individuals of different backgrounds including engineers, MBAs and technical experts with over 20 years of experience in the explosion protection field.

With past experience as application engineers, risk consultants and product managers in the explosion protection industry, our staff is constructed to deliver front-end analysis and backend implementation.

We have been the featured speaker at several industry conferences on industry standards on explosion protection strategies and have been published in various trade journals.

We are members of the National Fire Protection Association, American Institute of Chemical Engineers, and American Society of Safety Engineers.

Our Clients

Our clients are anyone and everyone interested in industrial process protection. Our clients are wide and varied including OEMs, manufacturers and engineering firms; each with a common hazard but a unique set of interests across the solution development stages, be it for packaged systems, new plant construction or existing plant modifications.

We work with risk managers, plant managers, safety specialists, plant engineers, operations managers, and all personnel with a focus on loss prevention.

We offer tangible solutions for what initially appears to our clients as an undefined problem.
